

TEAM INTRODUCTION

NeuroCrowd

Hackathon: 36-Hour Hackathon – NIT Tiruchirappalli

Project Title: NeuroCrowd – AI-Based Real-Time Crowd Intelligence And Risk Prediction System

College: Chennai Institute of Technology

Department: Computer Science and Engineering (Artificial Intelligence & Machine Learning)

Team Members

Team Lead : SYED ALI FATHIMA N

Member 1 : SOWMIYA N

Member 2 : MUBEENA BANU M

About Our Team

We are a team of Artificial Intelligence and Machine Learning students from Chennai Institute of Technology. We enjoy building technology that solves practical problems and creates a positive social impact.

For this hackathon, we developed **NeuroCrowd**, an AI-powered crowd safety monitoring system designed to predict potential crowd risks before they become dangerous. Our solution combines computer vision, crowd movement analysis, and machine learning to assist event organizers in monitoring large gatherings in real time and making faster safety decisions.

Throughout the hackathon, we focused on transforming our idea into a working prototype by improving detection accuracy, designing an interactive dashboard, and developing a predictive risk analysis system.

Our Goal

Our goal is to build an intelligent crowd safety solution that helps authorities detect congestion early, predict crowd risk, and recommend preventive actions before emergencies occur, ultimately making large public events safer for everyone.
